QUARTERLY RETAIL E-COMMERCE SALES 2nd QUARTER 2026

The Census Bureau of the Department of Commerce announced today that the estimate of U.S. retail e-commerce sales for the second quarter of 2026, adjusted for seasonal variation, but not for price changes, was \$340.2 billion, an increase of 3.8 percent (± 0.4 percent) from the first quarter of 2026. Total retail sales for the second quarter of 2026 were estimated at \$1,986.5 billion, an increase of 2.9 percent (± 0.2 percent) from the first quarter of 2026. The second quarter 2026 e-commerce estimate increased 12.2 percent (± 0.9 percent) from the second quarter of 2025 while total retail sales increased 6.7 percent (± 0.5 percent) in the same period. E-commerce sales in the second quarter of 2026 accounted for 17.1 percent of total sales.

On a not adjusted basis, the estimate of U.S. retail e-commerce sales for the second quarter of 2026 totaled \$329.5 billion, a increase of 9.4 percent (± 0.4 percent) from the first quarter of 2026. The second quarter 2026 e-commerce estimate increased 12.4 percent (± 0.9 percent) from the second quarter of 2025 while total retail sales increased 6.6 percent (± 0.5 percent) in the same period. E-commerce sales in the second quarter of 2026 accounted for 16.4 percent of total sales.

**Estimated Quarterly U.S. Retail E-commerce Sales as a Percent of Total Quarterly Retail Sales:
1st Quarter 2017 – 2nd Quarter 2026**

Percent of Total

The Quarterly Retail E-Commerce sales estimate for the third quarter of 2026 is scheduled for release on November 19, 2026 at 10:00 A.M. EST.

For information, including estimates from 4th quarter 1999 forward, visit the Census Bureau's Website at <http://www.census.gov/retail>. For additional information about Census Bureau e-business measurement programs and plans visit <https://www.census.gov/programs-surveys/e-stats.html>.

* The 90% confidence interval includes zero. The Census Bureau does not have sufficient statistical evidence to conclude that the actual change is different from zero.

Table 1. Estimated Quarterly U.S. Retail Sales: Total and E-commerce¹
(Estimates are based on data from the Monthly Retail Trade Survey and administrative records.)

Quarter	Retail Sales (millions of dollars)		E-commerce as a Percent of Total	Percent Change From Prior Quarter		Percent Change From Same Quarter A Year Ago	
	Total	E-commerce		Total	E-commerce	Total	E-commerce
Adjusted ²							
2nd quarter 2026(p)	1,986,488	340,244	17.1	2.9	3.8	6.7	12.2
1st quarter 2026(r)	1,929,759	327,861	17.0	1.5	3.1	3.9	10.1
4th quarter 2025	1,900,653	317,999	16.7	0.4	2.3	2.7	5.9
3rd quarter 2025	1,893,125	310,817	16.4	1.7	2.5	4.1	5.3
2nd quarter 2025(r)	1,861,603	303,284	16.3	0.2	1.9	3.7	5.0
Not Adjusted							
2nd quarter 2026(p)	2,011,977	329,530	16.4	11.5	9.4	6.6	12.4
1st quarter 2026(r)	1,804,536	301,242	16.7	-9.7	-17.5	4.0	9.3
4th quarter 2025	1,999,440	365,160	18.3	5.4	21.8	2.8	5.6
3rd quarter 2025	1,896,573	299,717	15.8	0.5	2.2	4.2	5.2
2nd quarter 2025	1,887,093	293,140	15.5	8.7	6.3	3.8	5.3

(p) Preliminary estimate. (r) Revised estimate.

¹ E-commerce sales are sales of goods and services where the buyer places an order, or the price and terms of the sale are negotiated over an Internet, mobile device (M-commerce), extranet, Electronic Data Interchange (EDI) network, electronic mail, or other comparable online system. Payment may or may not be made online. Estimates include data only for businesses with paid employees. Prior to the benchmark report released in April 2025, the Quarterly E-commerce estimates included nonemployers.

² Estimates are adjusted for seasonal variation, but not for price changes. Total sales estimates are also adjusted for trading-day differences and moving holidays.

Note: Table 2 provides estimated measures of sampling variability. For information on confidentiality protection, sampling error, nonsampling error, sample design, and definitions, see http://www.census.gov/retail/mrts/how_surveys_are_collected.html.

Table 2. Estimated Measures of Sampling Variability for Quarterly U.S. Retail Sales Estimates: Total and E-commerce

(Estimates are shown as percents and are based on data from the Monthly Retail Trade Survey.)

Quarter	Coefficient of Variation (CV)		Standard Error (SE) for E-commerce as a Percent of Total	SE for Percent Change From Prior Quarter		SE for Percent Change From Same Quarter A Year Ago	
	Total	E-commerce		Total	E-commerce	Total	E-commerce
2nd quarter 2026(p)	1.0	2.2	0.3	0.1	0.2	0.3	0.5
1st quarter 2026(r)	1.0	2.2	0.3	0.1	0.2	0.3	0.8
4th quarter 2025	0.9	2.2	0.3	0.1	0.3	0.3	1.0
3rd quarter 2025	0.9	2.1	0.3	0.1	0.2	0.2	0.7
2nd quarter 2025	0.9	2.1	0.3	0.2	0.5	0.2	0.7

(p) Preliminary estimate. (r) Revised estimate. (Z) Estimate is less than 0.05%.

Note: Estimated measures of sampling variability are based on data not adjusted for seasonal variation, trading-day differences, or moving holidays, and are used to make confidence statements about both adjusted and not adjusted estimates. For information on confidentiality protection, sampling error, nonsampling error, sample design, and definitions, see http://www.census.gov/retail/mrts/how_surveys_are_collected.html.

Survey Description

Retail e-commerce sales are estimated from the same sample used for the Monthly Retail Trade Survey (MRTS) to estimate preliminary and final U.S. retail sales. Advance U.S. retail sales are estimated from a subsample of the MRTS sample that is not of adequate size to measure changes in retail e-commerce sales.

A stratified simple random sampling method is used to select approximately 10,800 retail firms excluding food services whose sales are then weighted and benchmarked to represent the complete universe of over two million retail firms. The MRTS sample is probability based and represents all employer firms engaged in retail activities as defined by the North American Industry Classification System (NAICS). Coverage includes all retailers whether or not they are engaged in e-commerce. Online travel services, financial brokers and dealers, and ticket sales agencies are **not** classified as retail and are **not** included in either the total retail or retail e-commerce sales estimates. Previously, firms without paid employees, or nonemployers, were included in the estimates through a benchmarking adjustment factor. As of the April 2025 annual revision report, nonemployers are no longer included in the estimates and have been removed from the time series to be aligned with the Annual Integrated Economic Survey (AIES). E-commerce sales are included in the total monthly sales estimates.

The MRTS sample is updated on an ongoing basis to account for new retail employer businesses (including those selling via the Internet), business deaths, and other changes to the retail business universe. Firms are asked each month to report e-commerce sales separately. For each month of the quarter, data for nonresponding sampling units are imputed from responding sampling units falling within the same kind of business and sales size category or based on historical performance of that company. Responding firms account for approximately 68 percent of the e-commerce sales estimate and about 64 percent of the estimate of U.S. retail sales for any quarter.

For each month of the quarter, estimates are obtained by summing weighted sales (either reported or imputed). The monthly estimates are benchmarked to prior annual survey estimates. Estimates for the quarter are obtained by summing the monthly benchmarked estimates. The estimate for the most recent quarter is a preliminary estimate. Therefore, the estimate is subject to revision. Data users who create their own estimates using data from this report should cite the Census Bureau as the source of the input data only.

The Census Bureau has reviewed this data product to ensure appropriate access, use, and disclosure avoidance protection of the confidential source data (Project No. P-7504206, Disclosure Review Board (DRB) approval number: CBDRB-FY26-003).

Adjusted Estimates

This report publishes estimates that have been adjusted for seasonal variation and holiday and trading-day differences, but not for price changes. We used quarterly e-commerce sales estimates for 4th quarter 1999 to the current quarter as input to the X-13ARIMA-SEATS program to derive the adjusted estimates. For sales, we derived quarterly adjusted estimates by summing adjusted monthly sales estimates for each respective quarter. Seasonal adjustment of estimates is an approximation based on current and past experiences.

The X-13ARIMA-SEATS software improves upon the X-12 ARIMA seasonal adjustment software by providing enhanced diagnostics as well as incorporating an enhanced version of the Bank of Spain's SEATS (Signal Extraction in ARIMA Time Series) software, which uses an ARIMA model-based procedure instead of the X-11 filter-based approach to estimate seasonal factors. The X-13ARIMA-SEATS and X-12 ARIMA software produce identical results when using X-13ARIMA-SEATS with the X-11 filter-based adjustments. The X-13ARIMA-SEATS software and additional information on the X-13ARIMA-SEATS program may be found at <https://www.census.gov/data/software/x13as.html>.

Note that the retail estimates continue to be adjusted using the X-11 filter-based adjustment procedure.

Reliability of Estimates

Because the estimates in this report are based on a sample survey, they contain sampling error and nonsampling error.

Sampling error is the difference between the estimate and the result that would be obtained from a complete enumeration of the population conducted under the same survey conditions. This error occurs because only a subset of the entire population is measured in a sample survey. Standard errors and coefficients of variation, as given in Table 2 of this report, are estimated measures of sampling variation.

The margin of error, as used on page 1, gives a range about the estimate which is a 90 percent confidence interval. If, for example, the estimated percent change is -11.4% and its estimated standard error is 1.2%, then the margin of error is $\pm 1.753 \times 1.2\%$ or 2.1%, and the 90 percent confidence interval is -13.5% to -9.3%. Confidence intervals are computed based on the particular sample selected and canvassed. If one repeats the process of drawing all possible samples and forming all corresponding confidence intervals, approximately 90 percent of these individual confidence intervals would contain the estimate computed from a complete enumeration of all units on the sampling frame. If the confidence interval contains 0%, then one does not have sufficient evidence to conclude at the 90 percent confidence level that the change is different from zero.

Nonsampling error encompasses all other factors that contribute to the total error of a sample survey estimate. This type of error can occur because of nonresponse, insufficient coverage of the universe of retail businesses with e-commerce sales, mistakes in the recording and coding of data, and other errors of collection, response, coverage, or processing. Although not directly measured, precautionary steps are taken to minimize the effects of nonsampling error.
